

TORVIK HAULING — WEBSITE HANDOFF

Pointing torvikhauling.com to the new site

DNS setup at GoDaddy — about 15 minutes of your time, then 15–60 minutes for the internet to catch up.

Hi — your new site is live at a temporary URL while we get the domain switched over. The instructions below are exactly what to do at GoDaddy to point `torvikhauling.com` at the new site. None of this affects your email or anything else on the domain.

1 Sign in to GoDaddy

Go to **godaddy.com** → top-right → **Sign In**. Use the account that owns `torvikhauling.com`.

2 Open the DNS editor

- Click your name (top-right) → **My Products**
- Find `torvikhauling.com` in the list → click the **DNS** button (sometimes labeled **Manage DNS**)
- You'll land on a table of DNS records — that's where you're working

Take a screenshot of the DNS records page before you change anything. If something goes wrong we want to be able to put it back exactly how it was.

3 Find and remove conflicting records

You're only looking for two specific records that might conflict:

- An **A record** with Name `@` pointing to anything that isn't `76.76.21.21`
- A **CNAME** with Name `www` pointing to anything that isn't `cname.vercel-dns.com`

If you find either, delete it (or edit it to the new values in the next step).

Don't touch: MX records, TXT records, or NS records. Those handle email, verifications, and the registrar — leave them all alone.

4 Add the two new records

Click **Add** (or **Add New Record**) and create each of these:

Type	Name / Host	Value	TTL
A	@	76.76.21.21	600 (10 min)
CNAME	www	cname.vercel-dns.com	600 (10 min)

GoDaddy might call the "Name" field "Host" and require @ typed literally. If the CNAME field rejects `cname.vercel-dns.com`, try adding a trailing period: `cname.vercel-dns.com.`

5 Save and wait

Hit **Save**. GoDaddy will warn that DNS changes can take up to 48 hours — in practice it's usually 15 to 60 minutes.

You can check progress at **dnschecker.org**: paste `torvikhauling.com`, set type to **A**, hit **Search**. When most regions around the world show `76.76.21.21`, you're propagated.

6 Send confirmation when it's done

Once you've saved, send a quick text or email confirming the records are in. We'll confirm the new host sees the domain, issue the SSL certificate (automatic, takes about 30 seconds), and your site goes live at **https://torvikhauling.com** and **https://www.torvikhauling.com**.

The old Squarespace site stays alive at its `.squarespace.com` URL, but no one will reach it through the domain anymore — and we can cancel the Squarespace subscription whenever you're ready so you stop paying for it.

Will this affect my email?

No. We're not changing MX records (which handle email) or TXT records (SPF / DKIM verifications). Email at `@torvikhauling.com` — Google Workspace, forwarding, anything else — stays exactly as it is.

If you're using `torvikhauling@gmail.com` for everything (which is what the new site's contact form sends to), that's a Gmail address and isn't affected at all by domain DNS.

What if I get stuck?

Take a screenshot of the screen you're stuck on and send it over. Anywhere along the way — login, finding DNS, conflicting records, error messages — happy to walk through it live.
